1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 2. Claims 17-18 are rejected under 35 U.S.C. 102(e) as being anticipated by Sekiya et al (6590686).

Sekiya et al teach means to control a laser (20, 22, 24, means to control a modulation module (118, 42), a temperature controller (24), wavelength controller (22) and a current controlling supply means (20).

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 1- 4 and 7-10 and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sekiya et al (US006590686) in view of Nagakubo (5900621). Sekiya et al teach a temperature controller (30), a modulator bias controller (42) and digital control (output of element 36 in figure 8), a modulator bias controller (42), a temperature detection circuit (thermistor, column 4, line7), a temperature control circuit (Peltier element which is a type of thermo-electric cooler, column 4, line 9). Although

Application/Control Number: 10/665,098

Page 3

Art Unit: 2633

Sekiya et al do not specifically teach a power controller, Nagakubo et al (5900621) teach that it is well known to use a power controller (22, figure 16 or 23 in figure 17) in order to control the power output by the modulator. In regard to claims 10 and 8, he teaches a power monitoring circuit (15), power control circuit (12) and power driver (in that he has a drive signals for the attenuator, it is obvious, if not inherent that there is some means to provide the drive signal within element 12). It would have been obvious to modify Sekiya et al with the power control means of Nagakubo in order to control fluctuations caused by the laser and modulator. In regard to claim 7, see element 20.

- 5. Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over Sekiya et al (US006590686) in view of Nagakubo (5900621) as applied to claims 1-2 above, and further in view of Carlson et al (6285476) in view of Stapleton et al (RE 35,716).

 Although Sekiya et al does not teach specifics about how he provides the temperature control signal, Carlson et al teaches that is well known to use a PID control algorithm to provide the proper temperature setting for a laser (column 9, lines 51-56). Although Carlson does not specifically teach that he compares the temperature to a predetermined setting, Stapleton teaches comparing to a set point in order to provide a target (column 10, lines 14-21). It would have been obvious to provide the temperature control signal by utilizing a PID algorithm and comparing it to a set temperature as taught by Carlson and Stapleton in order to provide a stable temperature setting in order to avoid drift caused by temperature changes.
- 6. Claim 15 is rejected under 35 U.S.C. 102(b) as being anticipated by Kobayashi et al (6836622).

Kobayashi et al teach a method of controlling bias of a modulator (103) by generating a dither signal (112) and summing the dither signal (at TT) with a DC bias signal (118), receiving a signal related to the power from the Mach Zehnder (5), detecting bias error from a frequency component (107) and generating a DC bias voltage signal in response to the drift (119).

7. Claim 16 rejected under 35 U.S.C. 103(a) as being unpatentable over Kobayashi. Although Kobayashi doe not specifically teach that he sums his dither signal with an automatic gain control signal, he has amplifiers in his feedback loop. It would have been obvious, if not inherent that the feedback loop be considered as an automatic gain control loop and therefore, the signal output would be an agc signal.

The following is a statement of reasons for the indication of allowable subject matter: the closest prior art of record (Sekiya and Kobayashi) do not teach nor render obvious having a pid control algorithm with the details of the wavelength controller and controlling the temperature based on the predetermined wavelength signal. In regard to claim 11, there is not a dither signal buffering circuit, nor is there a reason to modify either Sekiya or Kobayashi to include a buffering circuit.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Leslie Pascal whose telephone number is 571-272-3032. The examiner can normally be reached on Monday, Friday 6:30-5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jason Chan can be reached on 571-272-3022. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
